Hi @larisa@landviser.com and @Melissa Hinga

Sorry for the delay.

Attached to this email is the REST API documentation for GET and POST calls. Also, there is a CSV file as an example for you to test.

I ran some tests and unfortunately the project and view parameters that you will find in the documentation are individually per project. Which means that every new farmer in the system will have a unique ID. Since the clay content is something that doesn't change, once this integration is done for a new farmer we don't need to do it again, we can think in some ways to amend this.

I'll also have a meeting Monday with our R&D to check if there is another way to do this without changing parameters as we have new farmers. I'll keep you posted.

If you have any doubts on the documentation whatsoever please let me know. We can schedule a quick call next week so we can go over it.

Thank you so much for the Landviser reference material!!!!

Have a great weekend!
